

Mercury Free

Mercury is released out of every *silver amalgam filling* immediately upon placement and continues to release mercury through the filling in vapor and gas form. The problem here is that mercury vapor crosses the blood-brain barrier which causes neurological destruction.

We have developed a heavy metal detoxification program and we will work closely with your medical doctor or health care professional to help you achieve mercury detoxification and optimal health.

- Every amalgam filling placed in your teeth contains 43%-55% pure elemental mercury.
- Scientific documentation has demonstrated that there is an absorption rate of 80% or more of inhaled mercury vapor.
- Latest scientific facts from autopsies show the number of amalgam fillings in the mouth correlates with the amount of mercury found in the brain tissue, pituitary, thyroid, adrenal glands and kidneys.
- Lesions on the brain and in the spinal column where discs literally fused together from the mercury. Science has well documented that mercury causes various metabolic physiologic changes in living tissue and organs, including...**SUPPRESSION OF THE IMMUNE FUNCTION.**
- Science has shown that chronic exposure to minute doses of mercury will cause an accumulation of mercury to occur during the life time of the organism. This is due to the slow rate of elimination of mercury from the body. Mercury has an affinity for brain tissue, due to the high fat content, and is typically stored in excess when it crosses the blood-brain barrier.

This is not good news for you or your children.

- Mercury and its various compounds cross the placental membrane in concentrated measure and are taken up by the embryo and fetus. There is evidence that the fetal brain levels of mercury are 30% greater than maternal blood levels of mercury.
- Significant quantities of mercury can be passed to the nursing child through the mother's milk.
- Mercury can produce diseases of insidious onset which may be delayed as much as 20 years or more from initial exposure (body threshold is the key). We call this toxic body burden.
- High levels of mercury and aluminum found in the brains of Alzheimer's victims.

International Academy of Oral Medicine and Toxicology (IAOMT) PROTOCOL

The purpose of removing mercury amalgam from your teeth is to eliminate a major source of heavy metal toxins and thus inflammation from entering your body's biosystem.

However, the removal of mercury amalgam is potentially extremely dangerous to you, me, and my staff.

It is also dangerous to the environment if certain proven safety measures are not followed.

The IAOMT protocol that is used includes, most if not all, of the following:

- Pretoxification supplements taken to include nutrients 1 Month prior to your appointment
- A water tight rubber barrier flossed around the neck's of the teeth
- A saliva ejector placed under the barrier to remove mercury vapor, and a process of taking the fillings out in large chunks.
- A high speed suction placed next to the tooth called clean-ups
- A high volume Dent-Air-Vac placed next to your chin (Elephant trunk)
- A negative ion generator placed behind the chair to bind up any mercury vapor that escapes the vacuum
- Copious amounts of water sprayed at the amalgam to keep it cool
- Available medical oxygen delivered through a N2O monitoring system mask
- Sequential removal of the most electrically negatively charged fillings first (Rita-meter testing)
- A mercury trap is in place that contains 99+% of mercury waste to ensure environmental friendliness
- These steps are taken to provide your body with the least amount of mercury exposure possible thus allowing the best possible chance of an improvement to your health
